A, Title: Complete genome sequence of enterohemorrhagic Escherichia coli 0157:H7 and gend A. Reference number: A99629; MUID:21156231; PMID:11258796
A. Accession: D90695
A. Status: preliminary
A. Molecule type: DNA
A. Residues: 1-406 < HAV>
A. Residues: 1-406 < HAV>
A. Experimental source: strain 0157:H7, substrain RIMD 0509952
C. Genetics: C. Genetics: A. Genetics: C. Strain resistance protein

"Tetanus and botulinum-B neurotoxins block neurotransmitter release
by proteolytic cleavage of synaptobrevin.";

L. Nature 359:832-835(1992).

-1- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER

RELEASE. IT BINDS TO PERIPHERAL SYNAPSES, IS INTERNALIZED

AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD

WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT

INHIBITS NEURORRANSMITTER RELEASE BY ACTING AS A ZINC

ENDOPERTINASE THAT CLEAVES THE 76-GLN-|-PHE-77 BOND OF

SYNAPTOBREVIN-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MEDLINE-94013372; PubMed-8408542; Campbell K., East A.K., Collins M.D.; Gene probes for identification of the botulinal neurotoxin gene and specific identification of neurotoxin types B, E, and F."; J. The complete sequence of the locus of enterocyte effacement (LEE)
from enteropathogenic Escherichia coli E2348/69.";
Mol. Microbiol. 28:1-4(L998).
-: FUNCTION: NECESSARY FOR THE PRODUCTION OF ATTACHING AND EFFACING
LESIONS ON TISSUE CULTURE CELLS. BELIEVED TO MEDIATE ADHERENCE.
-: SUMCELLUAR LOCATION: OUTER SURRACE.
-: SIMILARITY: BELONGS TO THE INTIMIN/INVASIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              252 DSRFTANLGAGQRF------FLPENMLGYNV--FIDQDFSGDNTRLG---- 290

--- PATHARY: POLYKetide antibiotic tetracenomycin C biosynthesis.
--- SUBCELLULAR LOCATION: Integral membrane protein.
--- SIMILARITY: BELONGS TO THE MAJOR REALLITATOR FAMILY (ALSO KNOWN AS THE DRUG RESISTANCE TRANSLOCASE FAMILY).
                                                                                                                                                              Bacteria; Actinobacteria; Actinobacteria (class); Actinobacteridae; Actinomycetales; Streptomycineae; Streptomycetaceae; Streptomyces.
                                                                                                                                                                                                                                                                                                                                     Bacteriol. 174:3651-3658(1992).
- FUNCTION: RESISTANCE TO TETRACENOMYCIN C BY AN ACTIVE TETRACENOMYCIN C EFFLUX SYSTEM WHICH IS PROBABLY ENERGIZED BY
                                                                                                                                                                                                                                                                        Guilfoile P.G., Hutchinson C.R.;
"Sequence and transcriptional analysis of the Streptomyces glaucescens tcmAR tetracenomycin C resistance and repressor gene

-!- FUNCTION: Responsible for the transport of dicarboxylates such a sucinate, fumarate, and malate from the periplasm across the membrane. This transport system plays an important role in the energy supply of rhizobium-legume symbionts (By similarity).
-!- SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inner membrane; Symport;

-!- FUNCTION: BOTULING' TOXIN ACTS BY INHIBITING NEUROTRANSMITTER RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC ENDOPERILDASE THAT CLEAVES THE 76-GLN-|-PHE-77 BOND OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SYNAPTOBREVIN-2. CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 neurotoxin gene and

Submitted (DEC-1991) to the EMBL/GenBank/DDBJ databases.
Submitted (DEC-1991) to the transport of dicarboxylates such as election to the transport of dicarboxylates such as succinate, fumarate, and malate from the periplasm across the inner membrane. This transport system plays an important role in the energy supply of rhizobium-legume symbionts (By similarity). 68 I------LGGFLILGFDAVGIGLILTGAYLDIKALD-KNAPKA------AF 105 80 LFRDYHDAIRQIGALLIILFGFITLGVFRPEAMMKERRIHFKHKPSGFLGSVLIGMAFAA 139 106 KWTWGKGMMLAGAVTMAVTR------LTEIIIPFTFANSYNRKL----KNSLNIA 150 48; Gaps 28 AFLSYITGVSMDDVKT-----EKLLLQKRSLFHTLC-FLLGFSVIFIALGYGTSFIGS 79 CYTOPLASMIC MEMBRANE, PROMOTING EFFICIENT DISULFIDE BOND ISOMERIZATION OF PROTEINS LOCALIZED ON THE OUTER SURFACE OF THE MEMBRANE OR IN THE SPORE COAT. 11 AFCVFSSFAQADDSKSAFNLGAGEKLLAYETSKKDPIVPFLLN---LFLGFGIGSFAQGD Bacteria; Proteobacteria; aĺpha subdivision; Rhizobiaceae group; Rhizobiaceae; Rhizobium. -!- FUNCTION: THE S-LAXER IS A PARACRYSTALLINE MONO-LAYERED ASSEMBLY
OF PROTEINS WHICH COAT THE SURFACE OF BACTERIA. THIS PROTEIN IS
CRITICAL FOR VIRULENCE.
-!- SUBCELLULAR LOCATION: CELL WALL. THIS BACTERIUM IS COVERED BY A
S-LAYER WITH HEXAGONAL SYMMETRY.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
